

Top Ten Reasons to buy Document Detective

1. It's the only product to identify and remove Tracked Changes in PowerPoint.

Many of our competitors specifically state that PowerPoint does not have a Tracked Changes feature. Open PowerPoint's help dialog and search on "Tracked Changes." PowerPoint does have a Tracked Changes feature.

2. It's the only product to identify and terminate Microsoft's Ad Hoc Review.

Ad Hoc Review automatically enables Tracked Changes without warning when a Word, PowerPoint, and Excel file is attached to an Outlook email. Several studies indicate that 20-30% of the documents on the Internet have Ad Hoc Reviewing enabled.

3. It's the only product to flatten OLE objects, like spreadsheets into true images.

Many products claim to replace OLE objects with bitmaps, but they are really using Metafiles. Metafiles are capable of hiding information and should be avoided.

4. It's the only product to address problems created by Paste and Paste Special.

Paste and Paste Special are very powerful features with a very simple interface. Both do data conversions on the fly, and may create Metafiles and other hidden data structures without the user's knowledge.

5. It's the only product that detects and recovers deleted pages in Adobe PDF documents.

Most people incorrectly believe that PDF documents are an image. They are layered documents that are very similar to PowerPoint, and information deleted with a PDF editor may not be removed from the document.

6. Document Detective addresses more hidden data issues than any other product.

Some products claim to address 25 hidden data issues. The National Security Agency (NSA) has a list of 55 hidden data issues. Document Detective addresses well over 100 hidden data issues.

7. It is approved for handling sensitive National Security Information.

Most commercial metadata programs are inadequate for handling highly classified information. Document Detective has been approved to process National Security Information.

8. It facilitates the Government's requirement for 100% Reliable Human Review.

Our 4-step Review Checklist provides a computer controlled workflow that meets the full intent of the Government's review criteria when National Security Information is at risk.

9. It is the first step in any cross domain solution.

Document Detective is the client for our Transfer Agent server, which is designed to integrate with existing cross domain solutions (guards) and to automate electronic document transfers.

10. Our commitment to supporting the product with continuing research.

Other developers only respond to hidden data once it has been identified by the Government. ManTech SRS was the first to recognize many of the hidden data issues on the current NSA list, and we identified many of those items for the Government.
